Pick a number from 1 to 15

1 3 5 7
9 11 13 15

2 3 6 7
10 11 14 15

4 5 6 7
12 13 14 15

8 9 10 11
12 13 14 15

2	2	2	2	-2	-2	-2	-2
<u>+4</u>	<u>-4</u>	<u>+ -4</u>	<u>- -4</u>	<u>+4</u>	<u>-4</u>	<u>+ -4</u>	<u>- -4</u>
6	-2	-2	6	2	-6	-6	2

$$2-4 = -(4-2)$$

$$-2+4 = (4-2)$$

$$- - = + = ++$$

$$+ - = - = - +$$

$$\overbrace{
 \begin{array}{cccccccc}
 2 & 2 & 2 & 2 & 1/2 & 1/2 & 1/2 & 1/2 \\
 \underline{x4} & \underline{/4} & \underline{x1/4} & \underline{/1/4} & \underline{x4} & \underline{/4} & \underline{x1/4} & \underline{/1/4}
 \end{array}
 }$$

$$2 / 4 = 2/4 = 1/2$$

$$1/2 x 4 = 4/2 = 2$$

$$// = \mathbf{x} = \mathbf{x} \mathbf{x}$$

$$\mathbf{x} / = / = / \mathbf{x} \quad ?$$

$$1/3+1/3+1/3 = 3 \times 1/3 = 1 \quad \text{definition of a fraction}$$

$$-3=0 \quad -3 \quad 1/3=1 / 3 = 1 \overset{\circ}{-} 3 \quad (a)$$

$$3=0 \quad - - 3 \quad 3 = 1 / 1/3 \quad // = x \quad (b)$$

$$0=1 \quad - = / \quad +=x \quad -3=1/3$$

$3+0=3$	identity	$3 \times 1=3$	
$3+0-2=3-2$	sub/div	$3 \times 1 / 4=3/4$	
$3+(0-2)=3-2$	assoc	$3 \times (1 / 4)=3/4$	
$3+-2=3-2$	transitive	$3 \times 1/4=3/4$	(a)

$3+0=3$	identity	$3 \times 1=3$	
$3+0- - 2=3- - 2$	sub/div	$3 \times 1 / 1 / 4=3 / 1/4$	
$3+(0- - 2)=3- - 2$	assoc	$3 \times (1 / 1/4)=3 / 1/4$	
$3+2 = 3- - 2$	transitive	$3 \times 4 = 3 / 1/4$	(b)

$1/3+1/3+1/3 = 3 \times 1/3 = 1$ definition of a fraction

$$-3=0 \quad -3 \quad 1/3=1 / 3 = 1-3 \quad (a)$$

$$3=0 \quad - - 3 \quad 3 = 1 / 1/3 \quad (b)$$

$$-3+3+-5+5=0+0=0 \quad \text{def} \quad 1/3 \times 3 \times 1/5 \times 5 = 1 \times 1 = 1$$

$$-3+-5+3+5=0 \quad \text{comm} \quad 1/3 \times 1/5 \times 3 \times 5 = 1$$

$$(-3+-5)+(3+5)=0 \quad \text{assoc} \quad (1/3 \times 1/5) \times (3 \times 5) = 1$$

$$-3+-5=0-(3+5) \quad \text{sub/div} \quad 1/3 \times 1/5 = 1 / (3 \times 5)$$

$$-3+-5=-(3+5) \quad \text{trans} \quad 1/3 \times 1/5 = 1 / (3 \times 5)$$

Something to think about:

$$1/3 = /3$$

$$3 \times 1/3 = 1 = 3 \times /3 \quad \text{x/=}$$

$$3 / 1/4 = 3 // 4 = 4 \times 3 \quad // = \text{x} \quad \text{corr}$$

What is a Fraction?

Division is reverse multiplication:

$$\begin{array}{l} 3 \times 2 = 6 \\ 3 \quad = 6 / 2 \\ 2 = 6 / 3 \end{array} \qquad \begin{array}{l} 3 \times ? = 2 \\ ? = 2 / 3 \end{array} \quad \text{Note: } 2 / 3 = 2 \div 3$$

This is multiplication: $3 \times 5 = 5 + 5 + 5$

Now let's make a discovery!

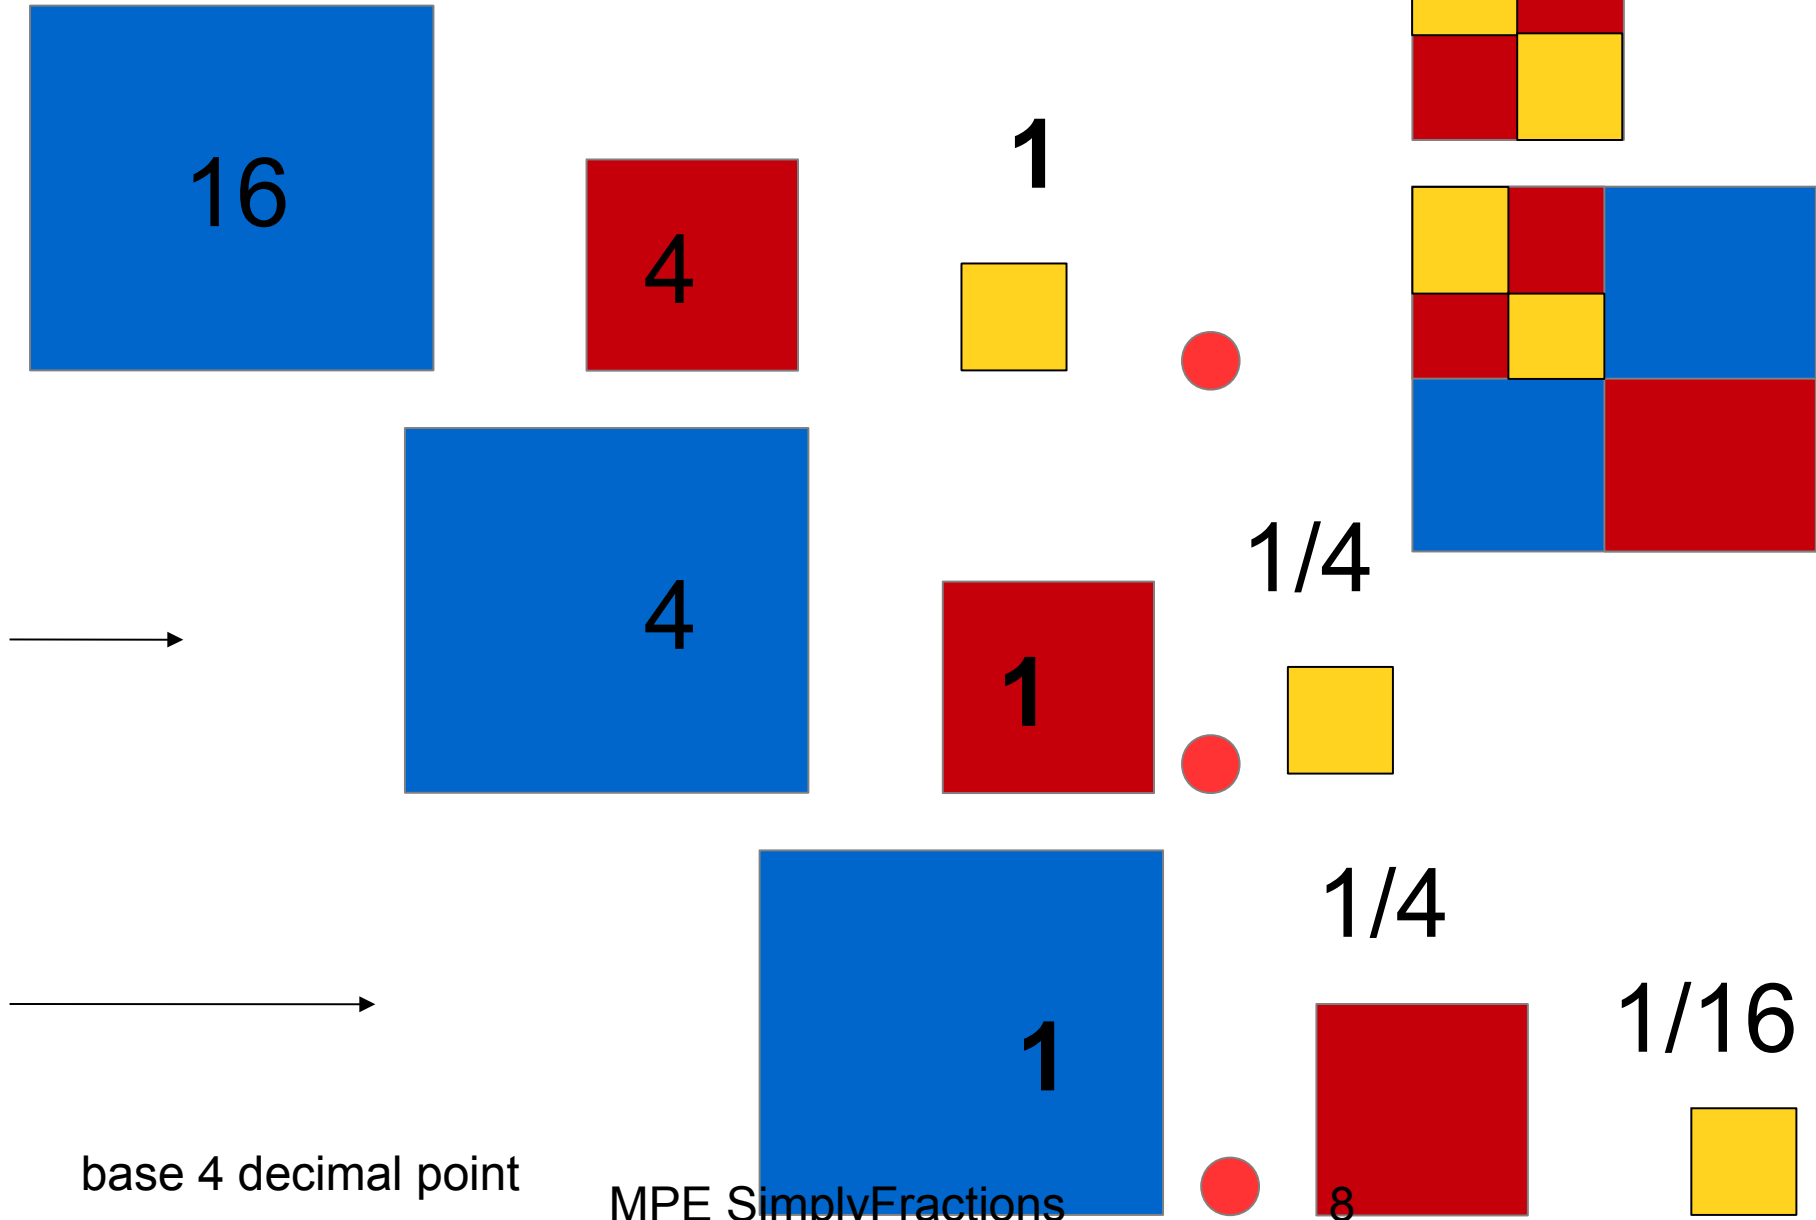

$$5 \times 1/5 = 1/5 + 1/5 + 1/5 + 1/5 + 1/5 = 1$$

A (unary) fraction is defined as:

$$n \times 1/n = 1 \qquad 1/n = /n \text{ (my notation)}$$

A (unary) fraction is defined such that when it is multiplied by its inverse (the denominator), we get the identity element for multiplication.

Fraction Point

base 4 decimal point

Classic mistakes

A month is not $1/12$ of a year, because the multiplication assumes **all the parts are the same**. Jan=31 days April=30 days

A week is not $1/52$ of a year 1 year =365 days $7 \times 52 = 364$
The product must be 1.

Cut a dollar into 100 pieces. One piece is not a cent, it is a piece of confetti. A **part of a whole** is **not the correct definition** for a fraction.

What is a proper fraction?

Basic Math properties:

Associative (grouping)

Commutative (ordering)

Identity (0 for +, 1 for x)

Distributive $(2+3) \times 7 = 2 \times 7 + 3 \times 7$

Transitive =

$$\begin{array}{ll} 3 \times 1/3 = 1 & \text{definition} \\ \text{(A)} \quad 1/3 = 1 / 3 & \text{division} \end{array}$$

$$3 \times 1 = 3 \quad \text{identity}$$

$$3 \times 1 / 7 = 3 / 7 \quad \text{division}$$

$$3 \times (1 / 7) = 3 / 7 \quad \text{association}$$

$$3 \times (1/7) = 3 / 7 \quad \text{transitive (A)}$$

Notation is very important (The little things count).

Dissecting a Proper Fraction

$3/7$ usually read as three sevenths

$3/7$ 3 divided by 7

$3/7 = 3 \times 1/7$

$3 \times 1/7$ my notation

$3/7 = 1/7 \times 3$ commutative property

$1/7 \times 3$ my notation

Just think of $1/7$ ($1/7$) as just another number element as one would think of an integer as a number element

A whole (1)

7 (equal) parts=whole

$1/7$

$3 \times 1/7 = 3/7$

Why do we add just the numerators when adding fractions (and not add the denominators too).

$$1/7 + 2/7 + 3/7$$

$$= 1 \times 1/7 + 2 \times 1/7 + 3 \times 1/7 \quad \text{transitive (notation)}$$

$$1x/7 + 2x/7 + 3x/7$$

$$= (1+2+3)x/7 \quad \text{distributive} \quad (1+2+3)x/7$$

$$= 6 \times 1/7 \quad \text{adding} \quad 6x/7$$

$$= 6/7 \quad \text{transitive (notation)}$$

Answer: Because of the distributive property.

That is why the denominators must be the same!

Question, use manipulatives to validate (verify)

Multiplying Fractions

$$\frac{1}{2} \times \frac{1}{3} = \frac{1}{(2 \times 3)} = \frac{1}{6}$$

$$\begin{aligned} \frac{2}{3} \times \frac{4}{5} &= 2 \times \frac{1}{3} \times 4 \times \frac{1}{5} \\ &= 2 \times 4 \times \frac{1}{3} \times \frac{1}{5} \\ &= 8 \times \frac{1}{15} = \frac{8}{15} \end{aligned}$$

Adding Fractions with different denominators

$$1 \times 6 = 6 \quad 1 = 6/6 \quad \text{also} \quad 6 = 6/1$$

$$1/2 = 1 \times 1/2 = 3/3 \times 1/2 = 3 \times 1 / 2 \times 3 = 3/6$$

$$1/2 + 1/3 = 1 \times 1/2 + 1 \times 1/3$$

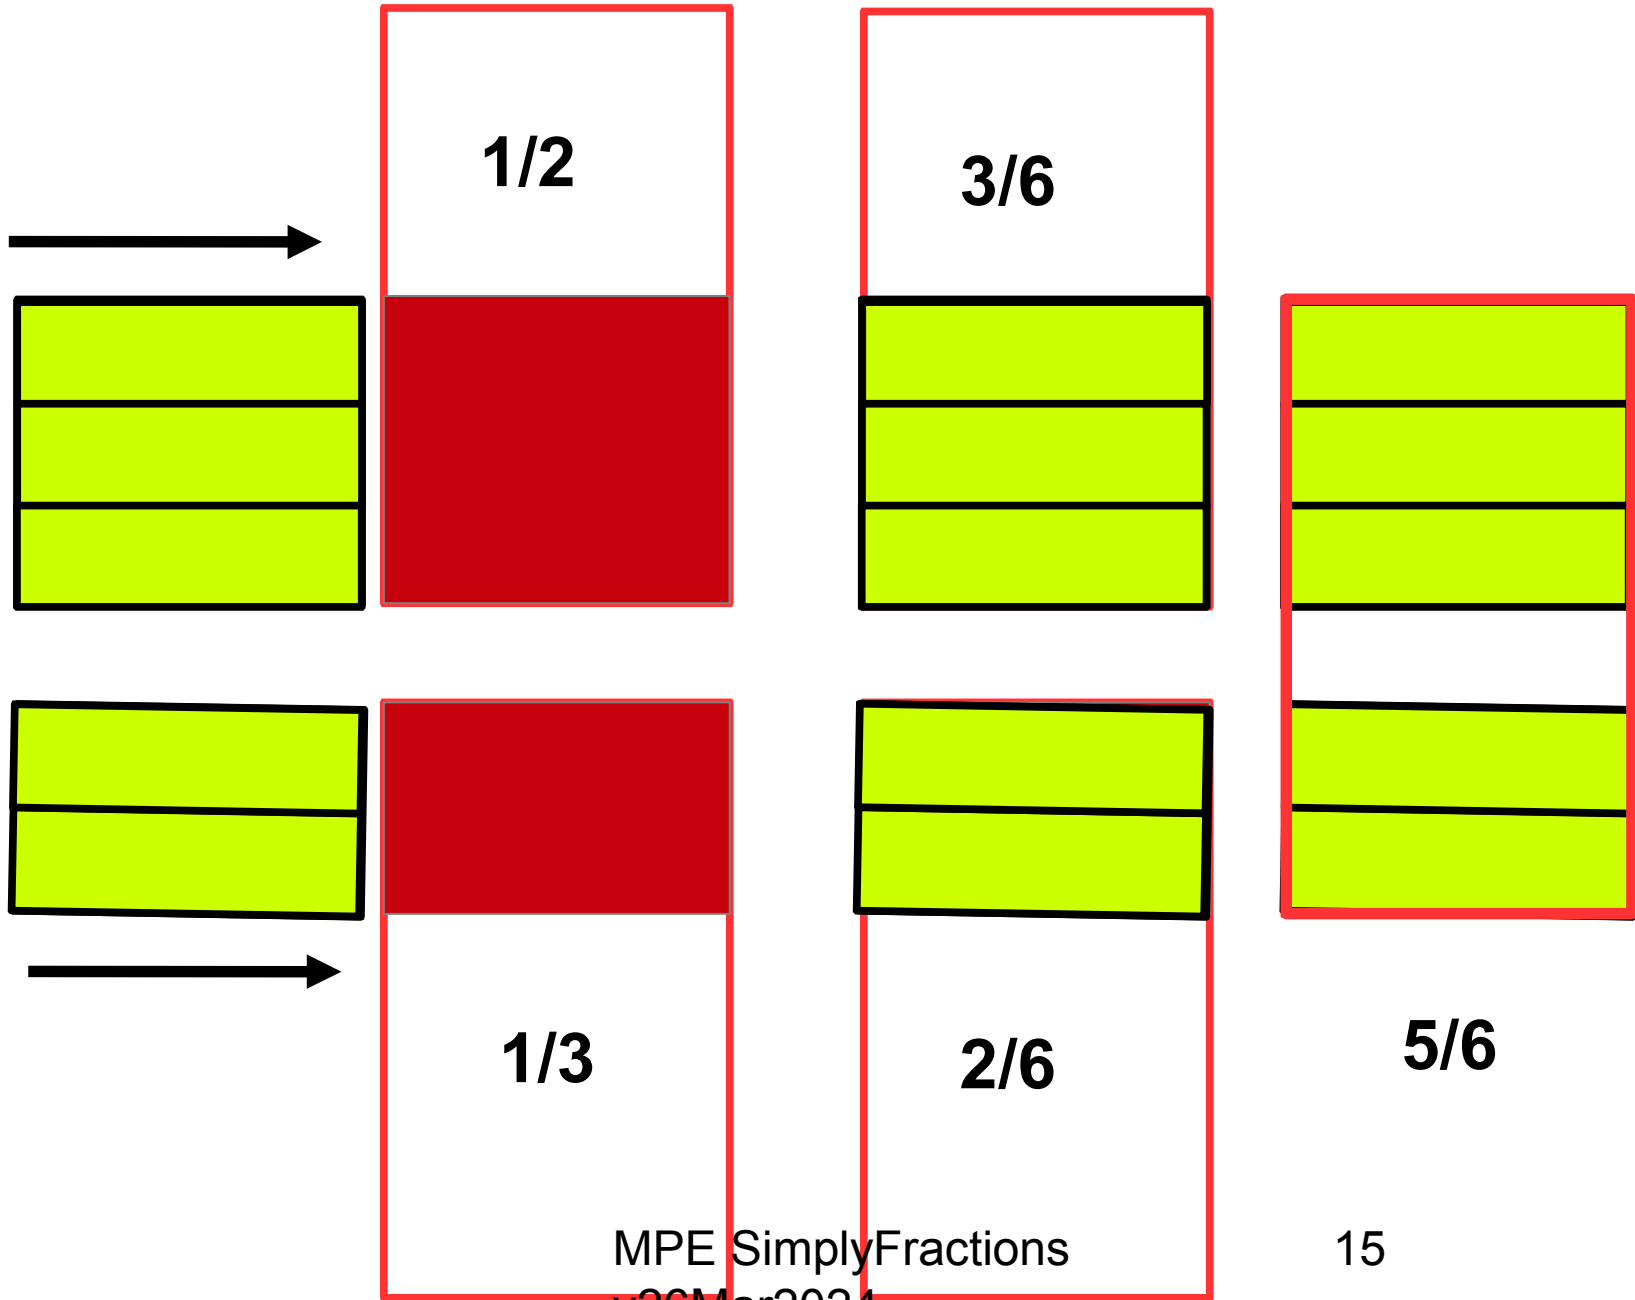

$$= 3/3 \times 1/2 + 2/2 \times 1/3$$

$$= 3 \times 1 / (3 \times 2) + 2 \times 1 / (2 \times 3)$$

$$= 3/6 + 2/6 = 5/6$$

Adding fractions with different denominators

Dividing fractions

$$6/5 \times 2/3 = 12/15$$

$$2/3 = 12/15 \div 6/5$$

$$5/6 \times 6/5 \times 2/3 = 5/6 \times 12/15$$

$$5 \times 6 / (5 \times 6) \times 2/3 = 12/15 \times 5/6$$

$$30/30 \times 2/3 = 12/15 \times 5/6$$

$$1 \times 2/3 = 12/15 \times 5/6$$

$$2/3 =$$

$$12/15 \times 5/6$$

↑
inverted
↓

$$12/15 = 4 \times 3 / (5 \times 3) = 4/5 \times 3/3 = 4/5 \times 1 = 4/5$$

$$4/5 \div 5/6 = 4 \times 5 / (5 \times 6) = 4/6 \times 5/5 = 4/6$$

$$4/6 = 2 \times 2 / (2 \times 3) = 2/2 \times 2/3 = 1 \times 2/3 = 2/3$$

Improper fractions

$$\begin{aligned}4 \frac{2}{3} &= 4 + \frac{2}{3} = \frac{3}{3} \times 4 + \frac{2}{3} \\ &= \frac{(4 \times 3)}{3} + \frac{2}{3} \\ &= \frac{(4 \times 3 + 2)}{3} \\ &= \frac{14}{3}\end{aligned}$$

$$\begin{aligned}\frac{14}{3} &= \frac{(4 \times 3 + 2)}{3} = 4 \times \frac{3}{3} + \frac{2}{3} \\ &= 4/1 \times \frac{3}{3} + \frac{2}{3} \\ &= 4 + \frac{2}{3} \\ &= 4 \frac{2}{3}\end{aligned}$$

Reducing Fractions

$$\begin{aligned} 375/1000 &= 3 \times 5 \times 5 \times 5 / (2 \times 2 \times 2 \times 5 \times 5 \times 5) \\ &= 3/8 \times 5 \times 5 \times 5 / (5 \times 5 \times 5) = 3/8 \times 1 \times 1 \times 1 = 3/8 \end{aligned}$$

$$\begin{aligned} 75 \times 5 / (5 \times 200) &= 75/200 \times (5/5) = 75 \times 200 \\ &= 5 \times 15 / (5 \times 40) = 15/40 \times 5/5 = 15/40 \\ &= 3 \times 5 / (8 \times 5) = 3/8 \times 5/5 = 3/8 \end{aligned}$$

Summary

Adding fractions with same denominators

Multiplying fractions

Integer as a fraction

1 as a fraction

Adding fractions different denominators

Reducing fractions

Mixed numbers

The Big Focus (Multiplication & Division)

Remember $3 \times 1/3 = 1$ and $1/3 = 1 / 3$ (a)

Note power of associative property:

$$3 \times 5 \times 1/35 = 1 = (3 \times 5) \times 1/(3 \times 5) \text{ so } 1/(3 \times 5) = 1 / (3 \times 5)$$

Let's begin:

$$3 \times 1/3 \times 5 \times 1/5 = 1 \times 1 = 1 \text{ definition } 3 \times 1/3 \times 5 \times 1/5 = 1 \times 1 = 1$$

$$3 \times 5 \times 1/3 \times 1/5 = 1 \quad \text{commutative} \quad 5 \times 1/3 \times 3 \times 1/5 = 1$$

$$(3 \times 5) \times (1/3 \times 1/5) = 1 \quad \text{associative} \quad (5 \times 1/3) \times (3 \times 1/5) = 1$$

$$1/3 \times 1/5 = 1 / (3 \times 5) \quad \text{division} \quad 3 \times 1/5 = 1 / (5 \times 1/3)$$

$$1/3 \times 1/5 = 1/(3 \times 5) \text{ (a) transitive} \quad 3/5 = 1 / 5/3$$

multiply numerators

invert fraction in division

Continuing:

$$(2 \times 7) \times 1/3 \times 1/5 = (2 \times 7) \times 1/(3 \times 5) \text{ multiplying}$$

$$2 \times 1/3 \times 7 \times 1/5 = (2 \times 7) \times (1/(3 \times 5)) \text{ commutative}$$

$$2/3 \times 7/5 = (2 \times 7)/(3 \times 5) \text{ transitive (notation)}$$

Adding fractions of different denominators (The importance of 1)

Note: $1=7 \times 1/7 = 7/7$ notation

Just make the denominators the same

$$\begin{aligned} & 2/5 + 3/7 \\ &= 1 \times 2/5 + 1 \times 3/7 && \text{identity} \\ &= 7/7 \times 2/5 + 5/5 \times 3/7 && \text{transitive} \\ &= (7 \times 2)/(7 \times 5) + (5 \times 3)/(5 \times 7) && \text{multiply fractions} \\ &= ((7 \times 2) + (5 \times 3))/(5 \times 7) && \text{adding fractions} \\ &= (14 + 15)/35 = 29/35 \end{aligned}$$

Reducing fractions(Prime Numbers)

$$\begin{aligned} 60/72 &= (2 \times 2 \times 3 \times 5)/(2 \times 2 \times 2 \times 3 \times 3) && \text{Transitive (factoring)} \\ &= 2/2 \times 2/2 \times 3/3 \times 5/(2 \times 3) && \text{multiply fractions} \\ &= 1 \times 1 \times 1 \times 5/6 = 5/6 && \text{transitive} \end{aligned}$$

Mixed numbers and improper fractions

Note: $3 \times 1 = 3$ **identity**
 $3 = 3/1$ **division**

$3 \frac{3}{7} = 3 + \frac{3}{7}$ **notation**
 $= \frac{3}{1} + \frac{3}{7}$ **transitive**
 $= \frac{7}{7} \times \frac{3}{1} + \frac{3}{7}$ **identity**
 $= \frac{(7 \times 3)}{(7 \times 1)} + \frac{3}{7}$ **multiplying**
 $= \frac{(7 \times 3) + 3}{7}$ **adding**
 $= \frac{(21 + 3)}{7} = \frac{24}{7}$ **transitive**

Applying what we learned

$$3 \frac{2}{7} \times 7 \frac{3}{7} = ?$$

$$\begin{array}{r} 3 + \frac{2}{7} \\ \times 7 + \frac{3}{7} \\ \hline 21 + 2 \\ \hline (1 + \frac{2}{7}) + \frac{6}{49} \\ \hline 24 \frac{20}{49} \end{array}$$

The old way

$$23/7 \times 52/7 = 23 \times 52 / 49$$

$$\begin{array}{r} 52 \\ \times 23 \\ \hline 156 \\ 104 \\ \hline 1196 \end{array} \qquad \begin{array}{r} \underline{24} \text{ r } 20 \\ 49 \overline{)1196} \\ \underline{-98} \\ 216 \\ \underline{-196} \\ 20 \end{array}$$

Time consuming and prone to mistakes

Discovery

Fractions and modular arithmetic

On a clock $12=2 \times 12=3 \times 12=4 \times 12=\dots$

$$\frac{1}{4} \times (8 \quad 8+12 \quad 8+24 \quad 8+36) \\ = \quad \quad 2 \quad \quad 5 \quad \quad 8 \quad \quad 11$$

4 answers

Check:

$$4 \times 2 = 8$$

$$4 \times 5 = 20 = (20 - 12) = 8$$

$$4 \times 8 = 32 = (32 - 24) = 8$$

$$4 \times 11 = 44 = (44 - 36) = 8$$

Fractions and exponents

$$16^{1/4} = (16 \times e^{2n\pi i})^{1/4} = 2 \times (e^{0} \quad e^{\pi i/2} \quad e^{\pi i} \quad e^{3\pi i/2}) \\ = \quad 2 \quad 2i \quad -2 \quad -2i$$

4 answers

Summary

Importance of the basic postulates of arithmetic

A set of rules based upon observation

Knowing definitions is important

Proving the rules lets us understand what we are doing and makes it easier to retain what we learned

Manipulatives should be used for validation

Understanding leads to discovery (thinking)

$$\begin{aligned}n \times 1/n &= 1 = n/n \text{ definition} & n/m &= n \times 1/m \\n/m \times p/q &= (n \times p)/(m \times q) & 1 / (n/m) &= m/n \\n/m + p/q &= ((n \times q) + (m \times p))/(m \times q)\end{aligned}$$

Sample Problems

$$1/11 + 5/11 + 4/11 =$$

$$3/7 + 2/5 =$$

$$2/9 \times 5/7 =$$

$$6/72 =$$

Convert to mixed and improper fractions

$$23/5 =$$

$$3 \frac{2}{5} =$$

Do two ways

$$3 \frac{2}{7} \times 7 \frac{3}{7} =$$

Reduce

$$26/65$$

Division

$$4 \div 1/2 =$$

$$4 \times 1/2 =$$

$$1/4 \div 1/2 =$$

$$1/4 \times 1/2 =$$

$$1/2 \div 4 =$$

$$2/4$$
